

Max Rady College of Medicine Department of Family Medicine P228 Pathology Building 770 Bannatyne Avenue Winnipeg, Manitoba, R3E 0W3

Objectives: Inflammatory Bowel Disease and Colitis

- 1. In patients with evidence of a GI bleed, consider colitis or inflammatory bowel disease as a possible diagnose, given the appropriate clinical context.
- 2. In patients with chronic or recurrent diarrhea, look for both gastrointestinal and non-gastrointestinal symptoms and signs suggestive of inflammatory bowel disease or other types of colitis (e.g. celiac disease).
- 3. Given a patient with a diagnosis of inflammatory bowel disease (IBD), recognize extraintestinal manifestations.
- 4. In patients with evidence of infectious colitis, consider Clostridium difficile as the causative agent given the appropriate clinical context.
- 5. In patients with suspected viral gastroenteritis, do not prescribe antibiotics and advise conservative management.
- 6. In patients in whom you suspect has IBD or a non-infectious colitis, refer promptly for consideration of endoscopy.
- 7. In patients with a flare of otherwise stable non-infectious colitis, consider steroids as a bridge to disease modifying agents.
- 8. In patients with diagnosed IBD or non-infectious colitis, consider non-pharmacologic management as appropriate (e.g. nutritional support, vaccinations, osteoporosis screening, cancer screening in ulcerative colitis patients).

DFM Objectives: IBD and Colitis
